# Year 12 Methods

## Andrew Lorimer

# 1 Functions

- vertical line test
- each x value produces only one y value

### One to one functions

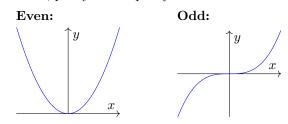

- f(x) is 1:1 if  $f(a) \neq f(b) \forall \{a, b\} \in \text{dom}(f)$  $\implies$  unique y for each x
- e.g.  $\sin x$  is not 1:1,  $x^3$  is
- horizontal line test
- if not one to one, it is many to one

### Odd and even functions

Even: 
$$f(x) = f(-x)$$
  
Odd:  $-f(x) = f(-x)$ 

Even  $\implies$  symmetrical across *y*-axis  $x^{\pm \frac{p}{q}}$  is odd if *q* is odd

For  $x^n$ , parity of  $n \equiv$  parity of function

#### **Inverse functions**

- Inverse of f(x) is denoted  $f^{-1}(x)$
- f must be one to one
- If f(g(x)) = x, then g is the inverse of f
- Represents reflection across y = x
- $\implies$   $f^{-1}(x) = f(x)$  intersections lie on y = x
- ran  $f = \text{dom } f^{-1}$ dom  $f = \text{ran } f^{-1}$
- "Inverse" ≠ "inverse function" (functions must pass vertical line test)

#### Finding $f^{-1}$

- 1. Let y = f(x)
- 2. Swap x and y ("take inverse"
- 3. Solve for y
  - Sqrt: state  $\pm$  solutions then restrict
- 4. State rule as  $f^{-1}(x) = ...$
- 5. For inverse *function*, state in function notation

#### Simultaneous equations (linear)

- Unique solution lines intersect at point
- Infinitely many solutions lines are equal
- No solution lines are parallel

Solving 
$$\begin{cases} px + qy = a \\ rx + sy = b \end{cases}$$
 for  $\{0, 1, \infty\}$  solutions

where all coefficients are known except for one, and a, bare known

- 1. Write as matrices:  $\begin{bmatrix} p & q \\ r & s \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} a \\ b \end{bmatrix}$
- 2. Find det(first matrix) =  $\bar{ps} \bar{q}s$
- 3. Let det = 0 for  $\{0, \infty\}$  solutions or det  $\neq 0$  for 1 solution
- 4. Solve to find variable

#### For infinite/no solutions:

- 5. Substitute variable into both original equations
- 6. Rearrange so that LHS of each is the same
- 7.  $\infty$  solns: RHS(1) = RHS(2)  $\implies$  (1) = (2)  $\forall x$

0 solns:  $\operatorname{RHS}(1) \neq \operatorname{RHS}(2) \implies (1) \neq (2) \forall x$ 

On CAS

 $\operatorname{Action} \to \operatorname{Matrix} \to \operatorname{Calculation} \to \texttt{det}$ 

Solving  $\begin{cases} a_1x + b_1y + c_1z = d_1 \\ a_2x + b_2y + c_2z = d_2 \\ a_3x + b_3y + c_3z = d_3 \end{cases}$ 

- Use elimination
- Generate two new equations with only two variables
- Rearrange & solve
- Substitute one variable into another equation to find another variable

### **Piecewise functions**

e.g. 
$$f(x) = \begin{cases} x^{1/3}, & x \le 0\\ 2, & 0 < x < 2\\ x, & x \ge 2 \end{cases}$$

Open circle: point included

Closed circle: point not included

```
On CAS
Define piecewise functions:
```

 $Math3 \rightarrow \boxed{\textcircled{3}}$ 

## **Operations on functions**

For  $f \pm g$  and  $f \times g$ :  $\operatorname{dom}' = \operatorname{dom}(f) \cap \operatorname{dom}(g)$ 

Addition of linear piecewise graphs: add y-values at key points

Product functions:

- product will equal 0 if f = 0 or g = 0
- $f'(x) = 0 \leq g'(x) = 0 \Rightarrow (f \times g)'(x) = 0$

## **Composite functions**

 $(f \circ g)(x)$  is defined iff  $\operatorname{ran}(g) \subseteq \operatorname{dom}(f)$ 

# 2 Polynomials

#### Factor theorem

```
General form \beta x + \alpha

If \beta x + \alpha is a factor of P(x),

then P(-\frac{\alpha}{\beta}) = 0.
```

Simple form x - a

If (x - a) is a factor of P(x), remainder R = 0.  $\implies P(a) = 0$ 

### Remainder theorem

When P(x) is divided by  $\beta x + \alpha,$  the remainder is  $-\frac{\alpha}{\beta}.$ 

## Rational root theorem

Let  $P(x) = a_n x^n + a_{n-1} x^{n-1} + \dots + a_1 x + a_0$  be a polynomial of degree n with  $a_i \in \mathbb{Z} \forall a$ . Let  $\alpha, \beta \in \mathbb{Z}$  such that their highest common factor is 1 (i.e. relatively prime). If  $\beta x + \alpha$  is a factor of P(x), then  $\beta$  divides  $a_n$  and  $\alpha$  divides  $a_0$ .

#### Discriminant

$$\begin{cases} b^2 - 4ac > 0 & \text{two solutions} \\ b^2 - 4ac = 0 & \text{one solution} \\ b^2 - 4ac < 0 & \text{no solutions} \end{cases}$$

Flip inequality sign when multiplying by -1

## Long division

$$\begin{array}{r} x+3 \\ x-1 \end{array} \underbrace{x+3} \\ x-1 \end{array} \\ \underline{-x^2 + x} \\ 3x+4 \\ \underline{-3x+3} \\ 7 \end{array}$$

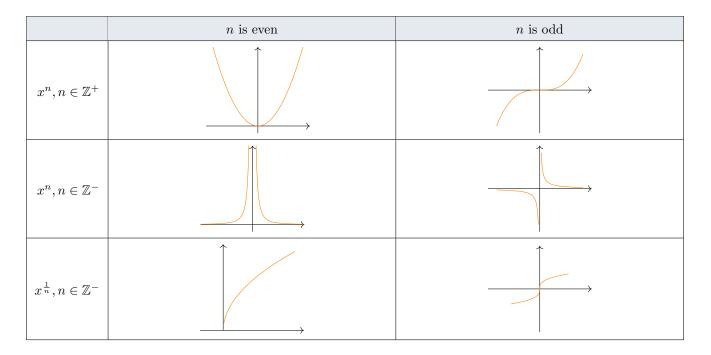

#### On CAS

Action  $\rightarrow$  Transformation  $\rightarrow$  propFrac

#### Linear equations

#### Forms

• y = mx + c

- $\frac{x}{a} + \frac{y}{b} = 1$  where  $(x_1, y_1)$  lies on the graph
- $y y_1 = m(x x_1)$  where (a, 0) and (0, b) are xand y-intercepts

### Line properties

Parallel lines:  $m_1 = m_2$ Perpendicular lines:  $m_1 \times m_2 = -1$ Distance:  $|\vec{AB}| = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$ 

# Quadratics

#### Linear factorisation

$$x^{2} + bx + c = (x + m)(x + n)$$

where mn = c, m + n = b

Difference of squares

$$a^2 - b^2 = (a - b)(a + b)$$

Perfect squares

$$a^2 \pm 2ab + b^2 = (a \pm b^2)$$

Completing the square

$$x^{2} + bx + c = (x + \frac{b}{2})^{2} + c - \frac{b^{2}}{4}$$
$$ax^{2} + bx + c = a(x - \frac{b}{2a})^{2} + c - \frac{b^{2}}{4a}$$

Quadratic formula

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$
(Discriminant  $\Delta = b^2$  –

# Cubics

Difference of cubes

$$a^3 - b^3 = (a - b)(a^2 + ab + b^2)$$

Sum of cubes

$$a^{3} + b^{3} = (a+b)(a^{2} - ab + b^{2})$$

Perfect cubes

$$a^3 \pm 3a^2b + 3ab^2 \pm b^3 = (a \pm b)^3$$

$$y = a(bx - h)^3 + c$$

- m = 0 at stationary point of inflection (i.e.  $(\frac{h}{b}, k)$ )
- $y = (x-a)^2(x-b)$  max at x = a, min at x = b
- y = a(x-b)(x-c)(x-d) roots at b, c, d
- $y = a(x-b)^2(x-c)$  roots at b (instantaneous), c (intercept)

# Quartic graphs

## Forms of quartic equations

$$y = ax^{4}$$
  

$$y = a(x - b)(x - c)(x - d)(x - e)$$
  

$$y = ax^{4} + cd^{2}(c \ge 0)$$
  

$$y = ax^{2}(x - b)(x - c)$$
  

$$y = a(x - b)^{2}(x - c)^{2}$$
  

$$- 4ac) \quad y = a(x - b)(x - c)^{3}$$

# 3 Transformations

### Order of operations: DRT

dilations — reflections — translations

# **Transforming** $x^n$ to $a(x-h)^n + K$

- dilation factor of |a| units parallel to y-axis or from x-axis
- if a < 0, graph is reflected over x-axis
- translation of k units  $\parallel y$ -axis/from x-axis
- translation of h units  $\parallel x$ -axis/from y-axis
- for  $(ax)^n$ , dilation factor is  $\frac{1}{a} \parallel x$ -axis/from y-axis
- when 0 < |a| < 1, graph becomes closer to axis

# **Transforming** f(x) to y = Af[n(x+c)] + b

Applies to exponential, log, trig,  $e^x$ , polynomials. Functions must be written in form y = Af[n(x+c)] + b

- dilation by factor |A| from x-axis (if A < 0, reflection across y-axis)</li>
- dilation by factor <sup>1</sup>/<sub>n</sub> from y-axis (if n < 0, reflection across x-axis)</li>
- translation of c units from y-axis (x-shift)
- translation of b units from x-axis (y-shift)

# Dilations

Two pairs of equivalent processes for y = f(x):

- 1. Dilating from x-axis:  $(x, y) \rightarrow (x, by)$ 
  - Replacing y with  $\frac{y}{b}$  to obtain y = bf(x)
- Dilating from y-axis: (x, y) → (ax, y)
  Replacing x with <sup>x</sup>/<sub>a</sub> to obtain y = f(<sup>x</sup>/<sub>a</sub>)

For graph of  $y = \frac{1}{x}$ , horizontal & vertical dilations are equivalent (symmetrical). If  $y = \frac{a}{x}$ , graph is contracted rather than dilated.

# Matrix transformations

Find new point (x', y'). Substitute these into original equation to find image with original variables (x, y).

#### Reflections

- Reflection **in** axis = reflection **over** axis = reflection **across** axis
- Translations do not change

## Translations

For y = f(x), these processes are equivalent:

- applying the translation (x, y) → (x + h, y + k) to the graph of y = f(x)
- replacing x with x h and y with y k to obtain y - k = f(x - h)

## Power functions

Mostly only on CAS. We can write  $x^{\frac{-1}{n}} = \frac{1}{x^{\frac{1}{n}}} = \frac{1}{n\sqrt{x}}n$ . Domain is:  $\begin{cases} \mathbb{R} \setminus \{0\} & \text{if } n \text{ is odd} \\ \mathbb{R}^+ & \text{if } n \text{ is even} \end{cases}$ If n is odd, it is an odd function.

 $x^{\frac{p}{q}}$  where  $p, q \in \mathbb{Z}^+$ 

$$x^{\frac{p}{q}} = \sqrt[q]{x^p}$$

- if p > q, the shape of  $x^p$  is dominant
- if p < q, the shape of  $x^{\frac{1}{q}}$  is dominant
- points (0,0) and (1,1) will always lie on graph

• Domain is: 
$$\begin{cases} \mathbb{R} & \text{if } q \text{ is odd} \\ \\ \mathbb{R}^+ \cup \{0\} & \text{if } q \text{ is even} \end{cases}$$

# 4 Exponentials & Logarithms

#### Logarithmic identities

$$\log_b(xy) = \log_b x + \log_b y$$
$$\log_b x^n = n \log_b x$$
$$\log_b y^{x^n} = x^n \log_b y$$
$$\log_a(\frac{m}{n}) = \log_a m - \log_a$$
$$\log_a(m^{-1}) = -\log_a m$$
$$\log_b c = \frac{\log_a c}{\log_a b}$$

#### Index identities

$$b^{m+n} = b^m \cdot b^n$$
$$(b^m)^n = b^{m \cdot n}$$
$$(b \cdot c)^n = b^n \cdot c^n$$
$$b^m \div a^n = b^{m-n}$$

#### **Inverse functions**

For  $f : \mathbb{R} \to \mathbb{R}, f(x) = a^x$ , inverse is:

$$f^{-1}: \mathbb{R}^+ \to \mathbb{R}, f^{-1} = \log_a x$$

Euler's number e

$$e = \lim_{n \to \infty} \left( 1 + \frac{1}{n} \right)^r$$

### Modelling

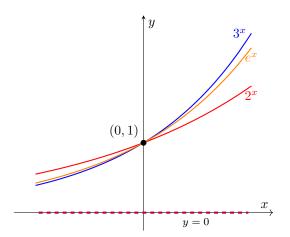

$$A = A_0 e^{kt}$$

- $A_0$  is initial value
- t is time taken
- k is a constant
- For continuous growth, k > 0
- For continuous decay, k < 0

#### Graphing exponential functions

$$f(x) = Aa^{k(x-b)} + c, \quad |a > 1$$

- y-intercept at  $(0, A \cdot a^{-kb} + c)$  as  $x \to \infty$
- horizontal asymptote at y = c
- domain is  $\mathbb{R}$
- range is  $(c,\infty)$
- dilation of factor |A| from x-axis
- dilation of factor  $\frac{1}{k}$  from *y*-axis

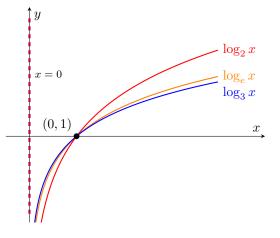

## Graphing logarithmic functions

 $\log_e x$  is the inverse of  $e^x$  (reflection across y = x)

$$f(x) = A \log_a k(x - b) + c$$

where

- domain is  $(b,\infty)$
- range is  ${\mathbb R}$
- vertical asymptote at x = b
- y-intercept exists if b < 0
- dilation of factor |A| from x-axis
- dilation of factor  $\frac{1}{k}$  from y-axis

#### **Finding equations**

 $\operatorname{On CAS:} \left. \begin{cases} f(3)=9\\ g(3)=0 \end{cases} \right|_{a,b}$ 

# 5 Circular functions

## Radians and degrees

$$1 \text{ rad} = \frac{180 \text{ deg}}{\pi}$$

#### Exact values

# Compound angle formulas

 $\cos(x \pm y) = \cos x + \cos y \mp \sin x \sin y$  $\sin(x \pm y) = \sin x \cos y \pm \cos x \sin y$  $\tan(x \pm y) = \frac{\tan x \pm \tan y}{1 \mp \tan x \tan y}$ 

### Double angle formulas

$$\cos 2x = \cos^2 x - \sin^2 x$$
$$= 1 - 2\sin^2 x$$
$$= 2\cos^2 x - 1$$
$$\sin 2x = 2\sin x \cos x$$
$$\tan 2x = \frac{2\tan x}{1 - \tan^2 x}$$

### Symmetry

$$\sin(\theta + \frac{\pi}{2}) = \sin\theta$$
$$\sin(\theta + \pi) = -\sin\theta$$

$$\cos(\theta + \frac{\pi}{2}) = -\cos\theta$$
$$\cos(\theta + \pi) = -\cos(\theta + \frac{3\pi}{2})$$
$$= \cos(-\theta)$$

#### **Complementary relationships**

$$\sin \theta = \cos(\frac{\pi}{2} - \theta)$$
$$= -\cos(\theta + \frac{\pi}{2})$$
$$\cos \theta = \sin(\frac{\pi}{2} - \theta)$$
$$= \sin(\theta + \frac{\pi}{2})$$

# Pythagorean identity

$$\cos^2\theta + \sin^2\theta = 1$$

#### sin and cos graphs

where:

Period = 
$$\frac{2\pi}{n}$$
  
dom =  $\mathbb{R}$   
ran =  $[-b + c, b + c];$   
cos(x) starts at (0, 1), sin(x) starts at (0, 0)  
0 amplitidue  $\implies$  straight line  
 $a < 0$  or  $b < 0$  inverts phase (swap sin and cos)  
 $c = T = \frac{2\pi}{b} \implies$  no net phase shift

 $f(x) = a\sin(bx - c) + d$ 

#### $\tan \, {\rm graphs}$

$$y = a \tan(nx)$$

Period 
$$=\frac{\pi}{n}$$

Range is  $\mathbb R$ 

Roots at 
$$x = \frac{k\pi}{n}$$
 where  $k \in \mathbb{Z}$   
Asymptotes at  $x = \frac{(2k+1)\pi}{2n}$ 

#### Asymptotes should always have equations

## Solving trig equations

- 1. Solve domain for  $n\theta$
- 2. Find solutions for  $n\theta$
- 3. Divide solutions by n

$$\sin 2\theta = \frac{\sqrt{3}}{2}, \quad \theta \in [0, 2\pi] \quad (\therefore 2\theta \in [0, 4\pi])$$
$$2\theta = \sin^{-1} \frac{\sqrt{3}}{2}$$
$$2\theta = \frac{\pi}{3}, \frac{2\pi}{3}, \frac{7\pi}{3}, \frac{8\pi}{3}$$
$$\therefore \theta = \frac{\pi}{6}, \frac{\pi}{3}, \frac{7\pi}{6}, \frac{4\pi}{3}$$

# 6 Calculus

## Average rate of change

$$m \text{ of } x \in [a,b] = \frac{f(b) - f(a)}{b - a} = \frac{dy}{dx}$$

On CAS: Action  $\rightarrow$  Calculation  $\rightarrow$  diff

#### Average value

$$f_{\rm avg} = \frac{1}{b-a} \int_a^b f(x) \, dx$$

#### Instantaneous rate of change

**Secant** - line passing through two points on a curve **Chord** - line segment joining two points on a curve

#### Limit theorems

- 1. For constant function f(x) = k,  $\lim_{x \to a} f(x) = k$
- 2.  $\lim_{x \to a} (f(x) \pm g(x)) = F \pm G$
- 3.  $\lim_{x \to a} (f(x) \times g(x)) = F \times G$
- 4.  $\lim_{x \to a} \frac{f(x)}{g(x)} = \frac{F}{G}, G \neq 0$

A function is continuous if  $L^- = L^+ = f(x)$  for all values of x.

#### First principles derivative

$$f'(x) = \lim_{h \to 0} \frac{f(x+h) - f(x)}{h}$$

Not differentiable at:

- discontinuous points
- sharp point/cusp
- vertical tangents ( $\infty$  gradient)

#### Tangents & gradients

**Tangent line** - defined by y = mx + c where  $m = \frac{dy}{dx}$  **Normal line** -  $\perp$  tangent  $(m_{tan} \cdot m_{norm} = -1)$ **Secant** =  $\frac{f(x+h)-f(x)}{h}$ 

### On CAS

In main: Interactive → Calculation → Line
tanLine(f(x), x, p)
normal(f(x), x, p)
where p is the x-value of the coordinate
In graph: define function, then Analysis →
Sketch → (Normal | Tan line). Type x value to
solve for a point. Return to show equation for line.

#### Strictly increasing/decreasing

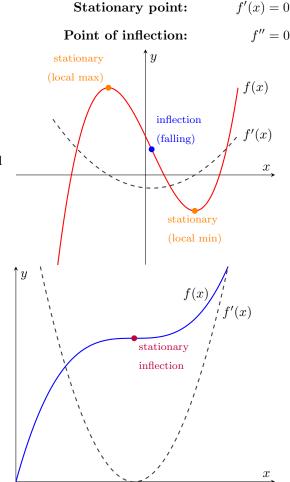

For  $x_2$  and  $x_1$  where  $x_2 > x_1$ :

• strictly increasing

where  $f(x_2) > f(x_1)$  or f'(x) > 0

- strictly decreasing where  $f(x_2) < f(x_1)$  or f'(x) < 0
- Endpoints are included, even where gradient = 0

#### **Stationary points**

# Distributions

Mean  $\mu$ 

$$E(X) = \frac{\sum [x \cdot f(x)]}{\sum f} \qquad (f = \text{absolute frequency})$$
$$= \sum_{i=1}^{n} [x_i \cdot \Pr(X = x_i)] \qquad (\text{discrete})$$
$$= \int_{\mathbf{X}} (x \cdot f(x)) \, dx$$

#### Mode

Value of X which has the highest probability

- Most popular value in discrete distributions
- Must exist in distribution
- Represented by local max in pdf
- Multiple modes exist when > 1X value have equalhighest probability

#### Median

Value separating lower and upper half of distribution area

#### **Continuous:**

$$m = X$$
 such that  $\int_{-\infty}^{m} f(x) dx = 0.5$ 

**Discrete:** (not in course)

- Does not have to exist in distribution
- Add values of X smallest to largest until sum is  $\geq 0.5$
- If  $X_1 < 0.5 < X_2$ , then median is the average of  $X_1$  and  $X_2$ 
  - If m > 0.5, then value of X that is reached is the median of X

### Variance $\sigma^2$

$$\operatorname{Var}(x) = \sum_{i=1}^{n} p_i (x_i - \mu)^2$$
$$= \sum (x - \mu)^2 \times \operatorname{Pr}(X = x)$$
$$= \sum x^2 \times p(x) - \mu^2$$
$$= \operatorname{E}(X^2) - [\operatorname{E}(X)]^2$$
$$= E \left[ (X - \mu)^2 \right]$$

Standard deviation  $\sigma$ 

$$\sigma = \operatorname{sd}(X)$$
$$= \sqrt{\operatorname{Var}(X)}$$

1 ( 77)

## **Binomial distributions**

Conditions for a *binomial distribution*:

- 1. Two possible outcomes: success or failure
- 2. Pr(success) (=p) is constant across trials
- 3. Finite number n of independent trials

#### **Properties of** $X \sim \operatorname{Bi}(n, p)$

$$\mu(X) = np$$
  

$$Var(X) = np(1-p)$$
  

$$\sigma(X) = \sqrt{np(1-p)}$$
  

$$Pr(X = x) = \binom{n}{x} \cdot p^{x} \cdot (1-p)^{n-x}$$

#### On CAS

# Continuous random variables

A continuous random variable X has a pdf f such that:

- 1.  $f(x) \ge 0 \forall x$
- 2.  $\int_{-\infty}^{\infty} f(x) \, dx = 1$

$$E(X) = \int_{\mathbf{X}} (x \cdot f(x)) \, dx$$
$$\operatorname{Var}(X) = E\left[ (X - \mu)^2 \right]$$

$$\Pr(X \le c) = \int_{-\infty}^{c} f(x) \, dx$$

## Two random variables X, Y

$$E(aX + bY) = a E(X) + b E(Y)$$
$$Var(aX \pm bY \pm c) = a^{2} Var(X) + b^{2} Var(Y)$$

**Linear functions**  $X \rightarrow aX + b$ 

$$\Pr(Y \le y) = \Pr(aX + b \le y)$$
$$= \Pr\left(X \le \frac{y - b}{a}\right)$$
$$= \int_{-\infty}^{\frac{y - b}{a}} f(x) \, dx$$

Mean: Variance:

$$E(aX + b) = a E(X) + b$$
$$Var(aX + b) = a^{2} Var(X)$$

#### Expectation theorems

For some non-linear function g, the expected value E(g(X)) is not equal to g(E(X)).

$$E(X^{2}) = \operatorname{Var}(X) - [E(X)]^{2}$$

$$E(X^{n}) = \Sigma x^{n} \cdot p(x) \qquad \text{(non-linear)}$$

$$\neq [E(X)]^{n}$$

$$E(aX \pm b) = aE(X) \pm b \qquad \text{(linear)}$$

$$E(b) = b \qquad (\forall b \in \mathbb{R})$$

E(X+Y) = E(X) + E(Y) (two variables)

#### Sample mean

Approximation of the **population mean** determined experimentally.

$$\overline{x} = \frac{\Sigma x}{n}$$

where

n is the size of the sample (number of sample points) x is the value of a sample point

#### On CAS

- 1. Spreadsheet
- 2. In cell A1: mean(randNorm(sd, mean, sample size))
- 3. Edit  $\rightarrow$  Fill  $\rightarrow$  Fill Range
- 4. Input range as A1:An where n is the number of samples
- 5. Graph  $\rightarrow$  Histogram

#### Sample size of n

$$\overline{X} = \sum_{i=1}^{n} \frac{x_i}{n} = \frac{\sum x_i}{n}$$

Sample mean is distributed with mean  $\mu$  and sd  $\frac{\sigma}{\sqrt{n}}$  (approaches these values for increasing sample size n).

For a new distribution with mean of *n* trials, E(X') = E(X),  $sd(X') = \frac{sd(X)}{\sqrt{n}}$ 

#### On CAS

- Spreadsheet → Catalog →
   randNorm(sd, mean, n) where n is the number of samples. Show histogram with Histogram key in top left
- To calculate parameters of a dataset: Calc  $\rightarrow$  One-variable

# Population sampling

#### Population proportion

```
p = \frac{n \text{ with attribute in population}}{\text{population size}}
```

Constant for a given population.

#### Sample proportion

 $\hat{p} = \frac{n \text{ with attribute in sample}}{\text{sample size}}$ 

Varies with each sample.

### Normal distributions

$$Z = \frac{X - \mu}{\sigma}$$

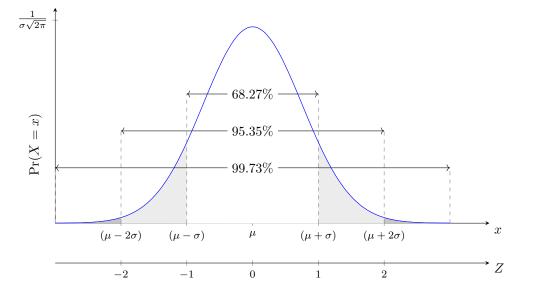

Normal distributions must have area (total prob.) of 1  $\implies \int_{-\infty}^{\infty} f(x) dx = 1$ 

mean = mode = median

Always express z as +ve. Express confidence interval as ordered pair.

#### **Confidence** intervals

- Point estimate: single-valued estimate of the population mean from the value of the sample mean  $\overline{x}$
- Interval estimate: confidence interval for population mean  $\mu$
- C% confidence interval  $\implies C\%$  of samples will contain population mean  $\mu$

#### On CAS

Menu  $\rightarrow$  Stats  $\rightarrow$  Calc  $\rightarrow$  Interval Set Type = One-Sample Z Int and select Variable

# Margin of error

For 95% confidence interval of  $\mu$ :

=

$$M = 1.96 \times \frac{\sigma}{\sqrt{n}}$$
$$= \frac{1}{2} \times \text{width of c.i.}$$
$$\Rightarrow n = \left(\frac{1.96\sigma}{M}\right)^2$$

Always round n up to a whole number of samples.

### General case

For C% c.i. of population mean  $\mu$ :

$$x \in \left(\overline{x} \pm k \frac{\sigma}{\sqrt{n}}\right)$$

where k is such that  $Pr(-k < Z < k) = \frac{C}{100}$ 

On CAS

Menu  $\rightarrow$  Stats  $\rightarrow$  Calc  $\rightarrow$  Interval Set Type = One-Prop Z Int Input  $\mathbf{x} = \hat{p} * n$ 

# 95% confidence interval

For 95% c.i. of population mean  $\mu:$ 

$$x \in \left(\overline{x} \pm 1.96 \frac{\sigma}{\sqrt{n}}\right)$$

where:

 $\overline{x}$  is the sample mean

 $\sigma$  is the population sd

n is the sample size from which  $\overline{x}$  was calculated

#### Confidence interval of p from $\hat{p}$

$$x \in \left(\hat{p} \pm Z\sqrt{\frac{\hat{p}(1-\hat{p})}{n}}\right)$$

# Confidence interval for multiple trials

For a set of n confidence intervals (samples), there is  $0.95^n$  chance that all n intervals contain the population mean  $\mu$ .
